Parameter	Value
Implementation	Plain Java (no GP library), microRTS engine from this repository, 8 evaluation threads
Unit type table	Version 2 (original, fine-tuned), move conflicts cancel both units
Population size	100 (code default 1200; reduced so that ten runs fit in a 16-hour budget)
Generations	200, stopping early if the best combat score improves by less than 0.005 in 100 generations
Initialisation	Ramped half-and-half, depths 2–6, terminal probability 0.35, half the trees harvest-seeded
Maximum tree depth	15
Elitism	5 distinct trees
Selection	Epsilon-lexicase on per-case shaped scores
Operators	Subtree crossover 0.6, subtree mutation 0.3, copy 0.1; constant nudge 0.5 within mutation
Duplicate retries	5
Game length	2 000 cycles; game ends after 300 cycles without any action
Fitness	Harmonic mean ($\varepsilon = 0.1$) of shaped scores; draw weight 0.25, loss weight 0.2
Games per individual	8 maps × 8 opponents × 2 sides = 128
SBGP	Dg = 4, Sg = 10, Wg = 10, Tg = 6 (Section M.3)
